Python package for EDA and data quality

Skills

Python
SQL
numpy
pandas
scikit-learn
Linux
ETL
Git
Docker
Mongodb
FastAPI
Microsoft PowerBI
Dask
AWS Glue
AWS Athena
AWS Lambda
AWS Redshift

Profile

Experienced software developer with a strong background in data engineering and data science. Proven track record of designing and implementing data-driven solutions in the tech industry. Proficient in using Python frameworks to manage workflows and orchestrate data pipelines.

Employment History

Data Scientist, ByteIQ Analytics, Bhubaneshwar

SEPTEMBER 2021 – PRESENT

As a skilled data scientist, I have developed expertise in EDA, data cleaning, model building and model deployment. I was also involved in building data pipeline by using python, pandas, relational and non relational databases.

I also do have the experience in web scraping by using libraries like requests, beautiful-soup and selenium.

Education

B.Tech, Centurion University of Technology and Management, Bhubaneshwar

JULY 2017 – JUNE 2021

Specialization in Data Science and ML.

Projects

ETL Pipeline for a regulatory company

MARCH 2023 – PRESENT

Building an ETL pipeline to collect data from azure table, transform and store in mongodb. Data will be collected and stored in azure table by 3rd party application. I am responsible for reading the data from azure table by using Azure API and transformation of the content and store it back in mongodb.

Converting one research paper from Georgia Tech into Python App

OCTOBER 2022 – FEBRUARY 2023

Converted the research paper into a full fledged product. I was part of the data science team. I was responsible to convert the algorithm on product availability ratio, forecasting the demand of the product across US considering the seasonality. Implemented FB prophet for forecasting and converted some proprietary algorithm into python functionalities.

ETL Pipeline for a fintech company

AUGUST 2022 – OCTOBER 2022

Built ETL pipeline for a fin-tech product. The data source was from payment gateway and stored inside transactional db of the application. The pipeline will do the extraction, transformation (aggregation and summarization), and load to the OLAP data warehouse for insight generation.

Key Technologies: Python, pandas, docker, fast api.

Datamart of a HRMS

NOVEMBER 2021 – JUNE 2022

A smart data mart was created to store insights created by the analytics team. The task was to read from the HRMS employee database, transform the data to fulfill the analytics need, and storing them inside an analytical data mart.

Key Technologies: Python, AWS RDS, ETL, cronjob

Hobbies

Learning new skills and implementing in hubby projects.

Currently working on building a text search engine on complaints data by using mongodb and elastic search.

I have written a python package for EDA, data quality. Link: https://github.com/isatyalytics/Daqua

Entity resolution for automotive industry

SEPTEMBER 2020 — SEPTEMBER 2021

Duplicate records are marked and merged and one unique record was created. The source data was in amazon Dynamo db, the script read the data from the source and runs the python script to find out the duplicate records, storing the result in PostgreSQL.

Key Technologies: AWS Dynamo db, Python, RDS (Postgres)

Data quality monitoring system for a lending company

JANUARY 2023 — FEBRUARY 2023

Build a python package to monitor data quality of the data warehouse. Considering some of the aspects like completeness, relevance and reliability. Functionalities are: reading from cloud data storage, running the logic to get the result and written to a mongodb instance.

Courses

Databricks lakehouse fundamentals, Databricks

Neo4j Fundamentals, Graph academy by Neo4j

Tools

Jupyter Notebook

pycharm

postman

DB Schema

Declaration

I hereby declare that the details and information given above is complete and true to the best of my knowledge.
